

Reverse engineering is the process of extracting the technical information from existing products. The CAD guys can provide digitised measurements for whatever your needs, size, shape or application.

**Recently bought a product ? Think you could make it better but can't afford the R&D Costs?**

We can take an existing product the has no 3D data available, scan the part to generate all the required data. This information is then uploaded into the CAD software where we are able to generate a 3D model. In conjunction with our customer we then work on validating the design changes, though our comprehensive CAE program. This process dramatically reduces the costs of R&D. We take a product that works, and add your improvements to make it better. You reap the benefits.
